PHIL314

Quiz #14

1. How does science and technology change our understanding of life and our understanding of death?

- Science and technology has changed our understanding of life and our understanding of death in that current advancements in the field of medicine has allowed us to better define what makes someone alive and what defines someone as dead. Medical technology has enabled the prolongation of life, but it has also raised complex ethical dilemmas concerning end-of-life care and the concept of a "good death." Assisted suicide, euthanasia, and decisions about life support have become critical issues in bioethics discussions, as well as raising questions about preserving life in the form of banking of cells or tissue.
